

CineVerse Entertainment

Internal Policy Guidelines — Data, AI & Analytics

Purpose

This document outlines CineVerse's internal policies for data handling, AI system usage, and analytics access. All employees and contractors with access to internal analytics tools must adhere to these guidelines. Violations may result in access revocation and disciplinary action.

1. Data Classification

Level 1 — Public: Aggregated performance metrics shared in press releases.

Level 2 — Internal: Detailed viewership data, regional breakdowns, engagement scores.

Level 3 — Confidential: Viewer PII, subscription tier data, marketing budgets, contract terms.

Level 4 — Restricted: Executive compensation, M&A; discussions, unreleased content.

2. AI Analytics Assistant — Permitted Uses

The CineVerse AI Analytics Assistant is approved for use by all employees with Level 2 clearance or above. Permitted queries include:

- Film performance metrics (revenue, ratings, completion rates).
- Regional engagement analysis and city-level performance breakdowns.
- Genre trend analysis and audience segmentation insights.
- Marketing ROI comparisons across campaigns and channels.
- Competitive benchmarking using internal historical data.

3. AI Analytics Assistant — Prohibited Uses

- Querying individual viewer PII (names, contact details, payment information).
- Exporting raw database tables or bulk downloading viewer records.
- Using AI outputs in external communications without approval from Legal.
- Attempting to bypass tool-based access controls via prompt manipulation.
- Sharing AI-generated reports externally without redacting confidential fields.

4. SQL & Data Query Policy

All database queries executed through the AI assistant are parameterised and logged. Direct database access is not permitted outside approved ETL pipelines. The AI assistant may only execute SELECT

queries on approved views — no INSERT, UPDATE, DELETE, or DDL operations are permitted. Query results exceeding 10,000 rows will be automatically truncated.

5. Retention & Audit

All AI assistant queries are logged with timestamp, user ID, query text, and tool calls executed. Logs are retained for 90 days. Sensitive fields (viewer PII) are masked in logs. The security team conducts monthly audits of query logs for policy compliance.
